AI Search Relevance Evaluator Task Brief

Downloadable task brief for approved candidate work.

Candidate and role

Candidate: Review copy

Application ID: review-copy-ai-search-relevance-evaluator

Company: Trinity-AI

Role: AI Search Relevance Evaluator

Task category: AI image-search relevance evaluation

Required skills: AI evaluation, visual grounding

Before you start

- Read the job description carefully and make sure your work sample matches the actual role.
- Advanced: degraded CCTV footage, hard-negative queries, and borderline visual evidence require calibrated decisions, explicit evidence, and reviewer escalation.
- Estimated time: 90 minutes to 2 hours including calibration, visual review, adjudication, quality check, and upload.
- This is a one-task assignment. Submit once the deliverable is complete.

Task to complete

- Open the attached CCTV-quality source image, read the labeling policy below, and complete a calibration pass before reviewing the production cases.
- Decide whether the image is a Strong match, Partial match, or Not a match. Separate object presence, attribute evidence, and scene/context evidence; a topical association alone is not enough.
- For every case, record the exact visible evidence, the image region where it appears, the strongest competing interpretation, and whether CCTV blur or occlusion changes the decision.
- Correct the AI judgment and assign confidence High, Medium, or Low. Any Low-confidence or policy-boundary case must be escalated with a recommended adjudication, not silently forced into a label.
- Run a consistency check across near-duplicate queries, then report false-positive and false-negative patterns in the model’s judgments.

Task packet

Attached image: ai-search-relevance-01.jpg. CCTV limitations: blur, glare, timestamp overlay, and dark corners are part of the evaluation; do not treat them as proof of absent objects.

IMG-SR-001
Query: red commuter bicycle
AI judgment: Strong match
Evidence target: bicycle, red frame, and ordinary street setting.

IMG-SR-002
Query: mountain bike on a forest trail
AI judgment: Strong match
Hard negative: decide whether a red city bicycle on a sidewalk satisfies either the vehicle type or scene constraint.

IMG-SR-003
Query: blue brick wall
AI judgment: Partial match
Attribute test: separate the wall color from the bicycle color and cite the visible region.

IMG-SR-004
Query: bicycle with a visible front basket
AI judgment: Strong match
Fine-grained test: verify the basket rather than assuming the rear rack is a front basket.

IMG-SR-005
Query: empty sidewalk beside a building
AI judgment: Strong match
Composition test: decide whether the bicycle makes the query only Partial or Not a match.

IMG-SR-006

Query: red vehicle parked outdoors
AI judgment: Partial match
Taxonomy test: decide whether bicycle-versus-vehicle ambiguity requires escalation.

IMG-SR-007
Query: brand-name bicycle
AI judgment: Strong match
Unsupported-attribute test: mark Not a match when no brand can be verified.

IMG-SR-008
Query: bicycle captured at night
AI judgment: Partial match
Time/context test: do not infer time of day from CCTV exposure alone.

Required decision values: Strong match, Partial match, Not a match. Required escalation values: Yes or No.

What to submit

- A CSV or spreadsheet with columns: image_id, query, ai_judgment, corrected_judgment, confidence, evidence_region, visible_evidence, competing_interpretation, escalation, rationale.

- A calibration note explaining the Strong versus Partial boundary and a mini confusion summary of AI errors by type.

- An escalation table for every Low-confidence or taxonomy-boundary case, including the recommended adjudication.

- The final filename or upload reference needed for reviewer evaluation.

Review checklist

- The attached CCTV image is opened and all eight cases have exactly one decision, confidence, and evidence region.

- Judgments distinguish object, attribute, and context evidence and do not infer brand, time, location, or specifications.

- Near-duplicate and hard-negative cases are handled consistently, with escalation used for genuine policy ambiguity.

- The model error summary is supported by the row-level decisions and the evidence remains readable despite degradation.

After upload

- Your home page status will move to Pending task review after you submit.

- Cash is credited only after reviewers mark the completed work successful and payout eligibility is confirmed.

- If the task involves another participant, include their name and contact details in the submission notes for operations review.

AI Search Relevance Evaluator

How to complete the response tables

Use this page before filling the tables. Every response should point to visible evidence in the image. If the footage cannot support a claim, say so explicitly rather than guessing.

FIELD	WHAT IT MEANS	HOW TO ANSWER	EXAMPLE
Corrected judgment	Your final label after checking the query against the image.	Choose Strong match when object, required attributes, and scene are supported; Partial when only some are supported; Not a match when a required element fails.	A bicycle is visible, but a mountain-bike/forest-trail query is Not a match.
Confidence	How certain you are in your corrected label after considering blur or occlusion.	High = clear evidence; Medium = usable but imperfect evidence; Low = meaningful ambiguity remains.	Low when a rack might be a basket but its position is unclear.
Evidence region	The approximate image area that supports your decision.	Name a stable location such as center-left bicycle frame, upper-right wall, or foreground table.	Center-left: red frame and two wheels.
Visible evidence	Only the facts you can directly see that support the label.	Describe object, attribute, and context separately. Do not infer brand, time, or location.	A red bicycle is visible beside a building; no brand is readable.
Competing interpretation	The strongest reasonable alternative reading of the same evidence.	State what could make the label different, not a random possibility.	The rear rack could be mistaken for a front basket.
Escalation	Whether a reviewer should resolve a policy boundary or severe ambiguity.	Yes only for genuine taxonomy, evidence, or policy ambiguity; otherwise No.	Yes for bicycle-versus-vehicle taxonomy ambiguity.
Rationale	A short audit trail connecting the evidence to the final decision.	Explain why the label is correct and why the AI judgment was accepted or changed.	Changed to Partial because the bicycle is visible but the forest-trail constraint is not met.

Guided response tables for the attached task brief

Decision table - core judgment fields

The query and AI judgment are pre-filled. Complete the judgment, confidence, and escalation columns.

CASE ID	QUERY	AI JUDGMENT	CORRECTED JUDGMENT	CONFIDENCE	ESCALATION
IMG-SR-001	red commuter bicycle	Strong match			
IMG-SR-002	mountain bike on a forest trail	Strong match			
IMG-SR-003	blue brick wall	Partial match			
IMG-SR-004	bicycle with a visible front basket	Strong match			

AI Search Relevance Evaluator

Guided response tables for the attached task brief

Decision table - core judgment fields

The query and AI judgment are pre-filled. Complete the judgment, confidence, and escalation columns.

CASE ID	QUERY	AI JUDGMENT	CORRECTED JUDGMENT	CONFIDENCE	ESCALATION
IMG-SR-005	empty sidewalk beside a building	Strong match			
IMG-SR-006	red vehicle parked outdoors	Partial match			
IMG-SR-007	brand-name bicycle	Strong match			
IMG-SR-008	bicycle captured at night	Partial match
